MEDICAL CERTIFICATE

Date: Wed Mar 04 2026

Name: Bhavya Soni

Risk Score: 4.0

Clinical Interpretation

Structured Clinical Report

Patient Information:

* Name: Bhavya Soni

* Risk Score: 4.48%

Laboratory Results:

* Glucose Level: 98.0 mg/dL (normal range not specified)

* HbA1c Level: 5.4% (normal range: <6.5%)

Risk Factors:

The patient is identified to have the following top risk drivers:

Feature	Impact
---	---
GenHlth	0.061237
HighBP	-0.040307
HighChol	-0.037549
BMI	-0.035754
Age	-0.032741

Based on the patient's risk score and laboratory results, it is recommended to:

- * Monitor blood glucose levels regularly to prevent hyperglycemia
- * Implement lifestyle modifications to reduce cardiovascular risk factors (e.g., high blood pressure, high cholesterol)
- * Consider medication therapy to manage hypertension and dyslipidemia if necessary

Recommendations:

1. Schedule regular follow-up appointments with the healthcare provider for monitoring of laboratory results and clinical status.
2. Encourage the patient to engage in a healthy lifestyle, including a balanced diet, regular exercise, and stress management techniques.
3. Consider referral to a specialist (e.g., cardiologist, endocrinologist) if necessary.

Next Steps:

1. Schedule follow-up appointment with the healthcare provider for further evaluation and management.
2. Continue monitoring of laboratory results and clinical status.

Disclaimer:

This report is intended as a summary of the patient's clinical information and does not constitute medical advice or diagnosis. The healthcare provider should be consulted for any questions or concerns regarding the patient's care.

Laboratory Values

Glucose: 98

HbA1c: 5.4

Recommendations

Follow lifestyle modification and periodic monitoring

RISK ASSESSMENT

High Risk (>60%)

CLINICAL OUTPUT

⚠ AUTONOMOUS DECISION

Clinical Report: Bhavya Soni

Risk Interpretation

The predicted diabetes risk score for Bhavya Soni is 4.48%, which falls within the moderate risk category (30–60%). This indicates that there is a moderate probability of developing type 2 diabetes in the future.

Laboratory Interpretation

Based on the laboratory results, Bhavya's fasting glucose level is 98.0 mg/dL, which is within the normal range of 70–99 mg/dL. The HbA1c result is 5.4%, indicating a prediabetes risk category (5.7–6.4%).

Key Risk Drivers

The SHAP values indicate that the following factors are influencing the prediction:

- * GenHlth: Self-reported general health status has a positive impact on the predicted diabetes risk, suggesting that Bhavya's overall health is contributing to their moderate risk.
- * Age: The negative SHAP value for age indicates that increasing age is decreasing the predicted diabetes risk, which is expected given the patient's relatively young age.

Clinical Recommendations

Based on the moderate risk category, I recommend that Bhavya Soni undergo regular monitoring of their blood glucose levels and HbA1c to track any changes in their condition. Additionally, they should maintain a healthy lifestyle, including a balanced diet and regular physical activity, to reduce their diabetes risk.

Preventive Advice

To further reduce the risk of developing type 2 diabetes, I suggest that Bhavya Soni:

- * Engage in at least 150 minutes of moderate-intensity aerobic exercise or 75 minutes of

regular physical activity.

* Limit their intake of sugary drinks, refined carbohydrates, and saturated fats.

Clinical Disclaimer

This clinical report is an AI-assisted risk assessment and not a medical diagnosis. The results should be used as a guide for further evaluation and management by a qualified healthcare professional.
